Water management is among the sectors most vulnerable to climate change, requiring an interdisciplinary approach to address its challenges. This seminar is the first in a series of three aimed at exploring the role of research across different fields of expertise, intending to develop a common language to understand and propose solutions for policies and the circular economy that support equitable water management under climate change. In the seminar, we will examine the key challenges currently affecting water management and discuss how climate change is reshaping water governance. The seminar will be held in a hybrid format. Participation is free and open to all.
